

# The new IP-DECT System

**Actually, what are the advantages of the new IP DECT system FONtevo will introduce by the end of August 2019? Here are a few hints:**

- **REAL Zero Touch Provisioning**

Although some vendors are mentioning "zero touch" in their brochures the real solution you will get with our solution!

That's how it works: Attach the master base to the network, the base will find the system. The two devices will exchange certificates and will switch into safe mode (using https). The base will get the credentials using provisioning (incl. the path where it will find the provisioning data from now on and the path for the LDAP phone book).

Without opening the web server of the base once it will be ready to work!!

This is how the configuring, changing or deleting of the handsets will work as well: simply from the user interface of the system.

The web server of the master base will only be necessary if additional bases should be configured for setup of a bigger infrastructure.

→ This solution makes the installation **extremely simple**. Means: **really time saving, less effort for the initial training!!**

- **One source**

The DECT system from us plus communication system from our side = service/support from one source.

Support Mo – Fr / 08:00 – 18:00

- **Conference**

With the new solution the three-party conference is working (with firmware 2.22 for the base / around end of August / only an update of the base is necessary)

- **Phone books**

The access to the main phone book via LDAP is provisioned by the system automatically – without anything to do. Works right away.

Besides this it is possible to define up to 10 individual department phone books (needs a little programming effort).

The usage is really easy: short press = LDAP system phone book, long press = local phone book.

- **Handsets**

The predominant majority describes the handsets spontaneously of the new solution as elegant, premium, convenient.

Even more: Now we have two handsets with scratch and disinfectant resistant surface (COMfortel M-510 and M-520) and one handset designed for hard work (COMfortel M-530) with rubberized surface and IP65 certification!

- **Ringling**

Differentiation of internal and external calls is available. More differentiations will become possible (e.g. door calls). In the meantime, this can be handled using VIP call with extra ringing tone for dedicated numbers.

- **Pricing**

The new system offers attractive and competitive prices – particularly for installations with a bigger number of handsets.

# The new IP-DECT System

## Another feature (coming soon)

- **SIP Text Messaging**

This is the feature for the display of messages e.g. send by alarm servers. The new DECT solution does not support this yet, but it is planned to implement this as soon as possible in one of the next releases.

## Noteworthy remarks

- **More features**

In conjunction with new firmware releases, further features are planned which will make the combination of the new DECT system with our ITC-systems even more exciting.

- **Compatibility**

Alternative handsets can be used with our bases – but only in GAP mode with all the usual limitations to minimal compatibility. Not really recommend.

We wish you a lot of success for the sales and the installation of our new IP-DECT system.

**Your FONtevo team**
